                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       19
                                                                                                                                                                                                                                5
```

the invention relates to a hyperthermostable protease derived from a thermophilic bacterium (especially Pyrococcus furiosus). The protease has working temperature 40-10-769-7 (optimum 80-95 deg-C), working ph 5-10 (optimum 6-8), and retains more than 90% of its activity after 8 hours at 95 deg.C. The invention giso provides gene sequences encoding a polypeptide of formula SIG-Ria-019-019-04-18-0-80. Where SIG is a signal peptide from subtilisin, and PRO is the above protease. Host cells especially Bacillus straigs transformed with vectors comprising the genes are used for the reconfunant production of the protease. The hyperthermostable protease which can be prepared in quantity suitable for industrial use, can be used as an additive for drugs, washing agents and foodstuffs and for chemical synthesis.

659 AA;

Sequence

for

Recombinant hyperthermostable protease from Pyrococcus furiosus and gene encoding it, for large scale production of the protease industrial use.

the invention relates to a hyperthermostable processe derived from a thermophilic bacterium (especially Pyrococcus furiosus). The protesse has working temperature 40-110° deg.C (optimum 80-95 deg.C), working pub 5-10 vorking temperature at 19.10° deg.C (optimum 80-95 deg.C), working pub 5-10 publishmum 80-95 deg.C. The invention also provides gene sequences encoding a style formula SiG-hardy Asnr-Ro, where SiG is a signal polypeptide from subtilision, and PRO is the above processe. Host cells peptide from subtilision, and PRO is the above processe. Host cells (especially Bacillus strains) transformed with vectors comprising the genes are used for the recombinant production of the processe. The hyperthermostable protesse. Which can be prepared in quantity suitable hyperthermostable protess. Which can be additive for drugs, washing agents and foodstuffs and for chémical synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        293 VVVAAGUSGPNKYIIGSPAAASKVIIVGAVDKYDVITSFSSRGPTADGRLKPEVVAPGNW 352

This sequence represents the protease from Pyrococcus furiosus DSM-3638. This sequence is a protease of the invention. The proteases of the invention have extremely high thermal stability. The proteases can be used as research reagents, and industrially in the food, drug and chemical industries.

The invention relates to a hyperthermostable protease derived from a thermophilic bacterium (especially Pyrococcus furiosus). The protesse has working temperature 40-10 deg-C (optimum 80-95 deg-C), working pF 5;10 (optimum 6-8), and retains more than 90% of its activity after 8 hours at 95 deg-C. The invention also provides gene sequences encoding a polypeptide of formula SiG-Ala-Gly-Gly-Asn-PRO, where SiG is a signal peptide from subtilisin, and PRO is the above protease. Host cells (especially Bacillus Strains) transformed with vectors comprising me genes are used for the recombinant production of the protease. The hyperthermostable protease which can be prepared in quantity suitable for industrial use, can be used as an additive for drugs, washing agents and foodstuffs and for chemical synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GAYDSNDNIASFSSRGPTADGRLKPEVYAPGYDIIAPRASGTSMGTPINDYYTKASGTSM 379

The invention relates to:a h.perthermostable protease derived from a thermophilic bacterium (especially Pyrococcus furiosus). The protease has working temperature 40.10 dec ( optimum 6.95 deg.C.), working pH 5.10 (optimum 6.95 deg.C.), working pH 5.10 (optimum 6.95), and retains more than 90% of its activity after 8 hours act 95 deg.C. The invention also provides gene sequences encoding a polypeptide of formula SiG-Ala-Gly-Gly-Asn-PRO, where SiG is a signal peptide from subtilisin, and RDO is the above protease. Host cells (especially Bacillus) transformed with vectors comprising the genes are used for the recombinant production of the protease. The hyperthermostable protease which can be prepared in quantity suitable for industrial use, can be used as an additive for drugs, washing agents and foodstuffs and for chamical synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   320 GAVDSNDNIASESSRGPTAEGREKPEVVAPGVDIIAPRASGTSMGTPINDYYTKASGTSM 379

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The Invention relates to the hyperthermostable protesse of Pyrococous furiosus and its prodn. as a recombinant protein in transformants using a vector carrying the protesse gene (AATOB141). A genomic DNA sequence of the invention is given in AATOB131 and its encoded protein in AAR87009.

```
This sequence is an asymmetric hydrolase encoded by the Streptomyces viridosporus dhpA gene. The enzyme acts on 4-substituted-1,4-dihydropyridine derivatives. The enzyme allows the efficient conversion of 4-substituted-1,4-dihydropyridine esters to chiral partially hydrolysed derivatives, i.e. use in the symbhesis of cardiovascular drugs suitable for the treatment of e.g. hypertension and ischaemic heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  374 ASGISMATPHVSGVGALILOÄHPSWTPDKVKTALIETADIVAPKEIADIAYGAGRVNVYK 433

                                                                                                                                                                                                                                                                                                                  This sequence represents a fragment of the protease from Thermococcus celer DSM-2416 (see AAW24121 for full length sequence). This sequence is a fragment of the protease of the invention. The proteases of the invention have extremely high thermal stability. The proteases can be used as research reagents, and industrially in the food, drug and chemical industries.

This sequence is a fusion protein comprising Streptomyces viridosporus dppA gene product (an asymmetric hydrolase) which acts on 4-substituted-1,4-dhydropyridine derivatives, and melanin from S. antibioticue. The blpA enzyme allows the efficient conversion of 4-substituted-1,4-dhydropyridine esters to chiral partially hydrolysed derivatives for use in the synthesis of cardiovascular drugs suitable for the treatment of e.g. hypertension and ischaemic heart disease.
                                                                                                                                                                                                                                                                                                                      663 KGTYLVDSWIAKDFGTLKGGIDWLVQPKLSVTKDT-TLTLDARTIKAADITVFDPK---<sub>6</sub> 717

                                                                                                                                                                                                                                                                                                                                                                     18;
                                                                                                                                                                                                         This sequence is a fragment of an asymmetric hydrolase which acts on 4-substituted-1,4-dihydropyridine derivatives. The DNA sequence encoding the hydrolase (DhpA) was isolated from the chromsonal DNA of Streptomyces viridosporus. The enzyme allows the efficient conversion of 4-substituted-1,4-dihydropyridine esters to chiral partially mydrolysed derivatives, for use in the synthesis of cardiovascular drugs suitable for the treatment of e.g. hypertension and ischaemic heart.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Constant of the

This invention relates to a process for the production of a foreign secretory protein through the construction of a recombinant coryneform secretory protein through the construction of a recombinant coryneform becterium. The coryneform becterium is transformed with an expression construct in which DNA encoding a target foreign protein pro-structure is ligated to the downstream region of DNA encoding the signal peptide algoriant the vector, the bacterium is cultured, and the pro-peptide cleaved from the vector and expressed protein. Transglutaminases produced using this process are useful in the food processing and pharmaceutical industries. The present useful in the food processing and pharmaceutical industries. The present used in examples illigizating the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                -IETADIVAPKEIADIAYGRURAVKAIKY--------DD---YAKLT 444

Microbiol. 10:371-384(1993).

1- FUNCTION: NOT REQUIRED FOR GROWTH OR SPORULATION.

1- SUBCELLULAR LOCATION: Secreted.

1- FIM: PROBABLY UNDERGOES C-TERMINAL PROCESSING OR PROTEOLYSIS.

SUBTILASE FAMILY: SULVINGS TO PEPTIDASE FAMILY S8; ALSO KNOWN AS THE SUBTILASE FAMILY.

Nakamura T., Yamagata Y., Ichishima E.;

Nuclecoide sequence of the subtilisin NAT gene, aprn, of Bacillus a buttils (natto).;

Blosci. Biotechnol. Blochem. 56:1869-1871(1992).

IT CATALYZES THE HYDROLYSIS OF PROTEINS AND PEPTIDE ANIDES.

IT CATALYZES THE HYDROLYSIS OF PROTEINS AND PEPTIDE ANIDES.

IT CATALYZES THE HYDROLYSIS of PROTEINS AND PEPTIDE ANIDES.

IT CATALYZES THE HYDROLYSIS of PROTEINS WITH broad specification of peptide bonds, and a preference for a large uncharged residual in Pl. Hydrolyses peptide anides.

SUBCELLULAR LOCATION: SECRETION OF SUBTILISIN IS ASSOCIATED WITH ONSET OF SPORULATION, AND MANY MUTATIONS WHICH BLOCK SPORULATION AT SARLY STAGES AFFECT EXPRESSION LEVELS OF SUBTILISIN. HOWEVER, SUBTILISIN STACES AFFECT EXPRESSION LEVELS OF SUBTILISIN. HOWEVER, SUBTILIZIN C. SIMILARITY: BELONGS TO PEPTIDASE PANILY SB: ALSO KNOWN AS THE SUBTILISE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This SWISS-PROT entry is copyright.
